Art Unit: 2137

DETAILED ACTION 1 2 3 This action is in response to the communication filed on 12/11/2005. 4 5 All objections and rejections not set forth below have been withdrawn. 6 7 Claim Rejections - 35 USC § 112 8 9 10 The following is a quotation of the second paragraph of 35 U.S.C. 112: 11 The specification shall conclude with one or more claims particularly pointing out and distinctly 12 claiming the subject matter which the applicant regards as his invention. 13 14 Claims 1, 6 – 8, 13, 14, and 19 – 29 are rejected under 35 U.S.C. 112, second 15 paragraph, as being indefinite for failing to particularly point out and distinctly 16 claim the subject matter which applicant regards as the invention. 17 18 Claim 1 recites the added limitation "the second key" in line 26. There is 19 insufficient antecedent basis for this limitation in the claim. For the purpose of 20 examination the examiner will presume the applicant to mean "the second password". 21 22 Similar to claim 1, claims 8 and 14 each recites the added limitation "the second 23 key" within. There is insufficient antecedent basis for this limitation in these claims. For

Application/Control Number: 10/099,779 Page 3

Art Unit: 2137

1 the purpose of examination the examiner will presume the applicant to mean "the 2 second password". 3 4 Claim 13 depends upon the canceled claim 12. There is insufficient antecedent 5 basis for claim 13. 6 7 All other depending claims have been rejected by virtue of their dependency. 8 9 10 Claim Rejections - 35 USC § 103 11 12 The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all 13 obviousness rejections set forth in this Office action: 14 (a) A patent may not be obtained though the invention is not identically disclosed or described as set 15 16 17 forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. 18 Patentability shall not be negatived by the manner in which the invention was made. 19 20 21 Claims 1, 6, 7, 8, 14, 19, 20, and 22 are rejected under 35 U.S.C. 103(a) as 22 being unpatentable over Al-Salgan, "Method and Apparatus for Encoding Keys", 23 U.S. Patent, 6,549,626 in view of Hosokawa, "Internet Broadcast Billing System". 24 U.S. Patent Publication, 2001/0023416 A1. 25 26 Regarding claim 1, Al-Salgan discloses:

Art Unit: 2137

1 receiving, at a security module, a first password corresponding a software 2 application (Al-Salgan, col. 2, lines 12-28, 49-63; fig. 2, elem. 204); generating, at a 3 security module, a first mask value based on the first password (Al-Salgan, col. 4, lines 4 29-46; fig. 2); combining, at a security module, the first mask value with a first 5 encryption key (Al-Salgan, col. 4, lines 49-52; fig. 2); 6 encrypting, at the security module, the tied key using a second encryption key 7 that is associated with the security module, the encrypting resulting in an encrypted tied 8 key (Al-Salgan, fig. 2). Furthermore, the applicant is kindly reminded of the evidence 9 submitted by the applicant's representative, admitting to the Prior Art's (Al-Salgan) 10 teachings ("Prior Art Flow Diagram", Telephonic Interview, 11/15/05). 11 returning the encrypted tied key to the software application (Al-Salgan, fig. 2, 12 elem. 246). Al-Salgan discloses the returning of the encrypted tied key to what is 13 termed the "user". Clear to those of ordinary skill in the art, the term "user" is a 14 reference to a user employing a computer-implemented application, an interface to the 15 security module. For understanding of such, the applicant's representative is 16 respectfully invited to consider the Applicant's own disclosure of the prior art, which 17 evidences that which was clear to those having knowledge of technology (Spec. pg. 1, 18 lines 16-17, 22-24; pg. 2, line 27 – pg. 3, line 2). Herein, the Applicants clearly equate, 19 viewing as interchangeable, a customer (a "human") with an application, meaning, more 20 specifically, that a human does not interact with the computer system as he/she would 21 interact with another human, but instead, interacts with the computer system via an 22 application. Thus, when one of ordinary skill in the art refers to a "customer" as using

20

21

22

an encryption key within a computer system, in actuality, that one is appropriately and reasonably referring to an "application" in employment by a user. Al-Salgan discloses a computer software security module as outputting an electronic key to a "user" via an output (fig. 2, elem. 246). Truly, one of ordinary skill in the art would believe as absurd the thought that Al-Salgan was actually implying a direct interaction between the software and human, such as the dropping of digital data bits into the palm of a the user's hand. No indeed, Al-Salgan is merely describing technology in harmony with the understanding of those having technical knowledge, and in a manner similar to the applicant's themselves. In accordance, Al-Salgan discloses a complete computer system comprising hardware and software for implementing both a security module and software means for a user to interact with and employ the security module (Al-Salgan, col. 3, lines 16-52). determining, at the software application, that the encrypted tied key corresponds to the security module; in response to the determining, sending the encrypted tied key and a second password form the software application to the security module over a computer network, the second password being the same as the first password (Al-Salqan, fig. 3, elems. 302,306). Herein, Al-Salqan discloses the transmission of a encrypted tied key and password within an interconnected group of computing elements. The examiner would like to point out that the limitation determining, at the software application, claimed within a method comprising steps, does not indicate who or what does the determining and how such a determination is conducted. Furthermore, the examiner takes note that the claim vaguely claims a correspondence

Art Unit: 2137

21

1 between a key and module, but provides no indication of what comprises the 2 correspondence. Al-Salgan discloses the above limitations, as the correct password 3 and a corresponding tied key of a user is passed to the security module via the software 4 means for enabling such interaction between the user and security module (Al-Salgan, 5 col. 3, lines 16-52). 6 receiving, at the security module, the encrypted tied key and the second 7 password from the software application; in response to receiving the encrypted tied key 8 and the second password, combining, at the security module, the encrypted tied key 9 and the second key, the combining resulting in a recovered tied key (Al-Salgan, fig. 3). 10 Furthermore, the applicant is kindly reminded of the evidence submitted by the 11 applicant's representative, admitting to the Prior Art's (Al-Salgan) teachings ("Prior Art 12 Flow Diagram", Telephonic Interview, 11/15/05). 13 generating a second mask value based on the second password (Al-Salgan, col. 14 4, lines 29-46; fig. 3). Furthermore, the applicant is kindly reminded of the evidence 15 submitted by the applicant's representative, admitting to the Prior Art's (Al-Salgan) 16 teachings ("Prior Art Flow Diagram", Telephonic Interview, 11/15/05): 17 separating a recovered encryption key from the recovered tied key using the 18 second mask value (Al-Salqan, col. 7, lines 45-49; fig. 3). Furthermore, the applicant is 19 kindly reminded of the evidence submitted by the applicant's representative, admitting 20 to the Prior Art's (Al-Salgan) teaching of the recovery of an recovered encryption key

from the recovered tied key ("Prior Art Flow Diagram", Telephonic Interview, 11/15/05).

Art Unit: 2137

Page 7

and encrypting data provided by the software application using the recovered generated key (Al-Salqan, Abstract, lines 1-3; col. 1, lines 21-28; col. 7, lines 48,49; col. 3, lines 52-56). First, regarding the limitation "provided by the software application", the examiner notes that such is descriptive language describing data. This has added no further structure to the claim, the data itself being non-functional descriptive material. Additionally, the examiner points out that the above-mentioned limitation provides no indication as to how the software provides data to be encrypted or to what or whom the software provides the data to be encrypted. Al-Salqan discloses the encryption of symmetric encryption keys. Al-Salqan discloses that keys, when they are requested and obtained by the user, are used to encrypt data (Al-Salqan, col. 3, lines 55-57; col. 7, lines 48-49). When an encryption key becomes lost, an authorized user of the key may recover the key for use again (Al-Salqan, col. 1, lines 61-65) Al-Salqan discloses that such symmetric encryption keys are used to encrypt and decrypt data, and for such, an application of software is used (Al-Salqan, col. 1, lines 61-65; col. 3, lines 16-52).

Al-Salqan discloses a system designed to ensure the secrecy of a data encryption key, such as a symmetric key. Secrecy is accomplished by encrypting the data encryption key. However, though Al-Salqan discloses enabling the secrecy of a symmetric data encryption key, it does not disclose the enabling of the authenticity of the key. Thus, Al-Salqan does not disclose wherein the first "encryption key" is derived from a generated key and a known value the combining resulting a tied key or that the

Art Unit: 2137

recovered "encryption key" includes a recovered generated key and a recovered known value.

Hosokawa discloses a method for the verification of the authenticity of a data-encryption key, the method being performed "as a security measure" (Hosokawa, par 37). This "security measure" of ensuring authenticity is additional to the security measure of ensuring secrecy - encrypting the data encryption key. The method comprises the creation of a "tied key", or an "encryption key" derived from a generated key and a known value (Hosokawa, par. 32, lines 8-12; par. 33, lines 1-5; par. 37, lines 11-13; par. 44, lines 11-18). Hosokawa attaches a "known value", a digital signature, to generated key, and thereby creates a "tied key". After the "tied key" is decrypted, the attached digital signature is compared to an authentic digital signature so as to verify the authenticity of the generated key. If authentic, the generated key is used for encrypting data. Thus, Hosokawa discloses a method usable to verify the authenticity of an encryption key, the method ensuring a measure of security.

It would have been obvious to one of ordinary skill in the art to combine the method of Hosokawa with the system of Al-Salqan. This would have been obvious because one of ordinary skill in the art would have been motivated to enhance the security of the system of Al-Salqan, by not only enabling the secrecy of the data encryption key, but also the authentication of the data encryption key. Thus, a more secure system is provided.

Regarding claim 6, the combination of Al-Salgan and Hosokawa disclose:

Art Unit: 2137

determining whether the recovered known value is correct; and processing a

data file based on the determination (Hosokawa, col. 2, pars. 32, 33; Al-Salqan,

Abstract, lines 1-3; col. 7, lines 37-49; col. 3, lines 52-56).

Regarding claim 7, the combination of Al-Salqan and Hosokawa disclose:

Page 9

wherein the processing is selected from the group consisting of encrypting the data file using the recovered generated key and decrypting the data file using the recovered generated key (Al-Salqan, Abstract, lines 1-3; col. 7, lines 37-49; col. 3, lines 52-56).

Regarding claim 22, the combination of Al-Salqan and Hosokawa disclose: wherein the generated key is at a level of security corresponding to a sensitivity level of the data being encrypted (Hosokawa, par. 41). The combination of Al-Salqan and Hosokawa disclose that the key is appropriately used for securing data, thus the key is at a level of security suitable for securing sensitive data.

Regarding claims 8, 14, 19, and 20, they are the system means and computer program product claims implementing the method of claims 1, 6, and 7, and they are rejected, at least, for the same reasons. Further, regarding claim 8 specifically, it is rejected because the combination of Al-Salqan and Hosokawa disclose:

one or more processors; a memory accessible by the processors; one or more nonvolatile storage devices accessible by the processors; a hardware security module

Art Unit: 2137

1 accessible by the processors; a data security tool for securing data using the hardware

Page 10

2 security module (Al-Salqan, figs. 1, 2; col. 3, lines 16-45).

Claims 21, 23, 24, 26, 27, and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Al-Salqan and Hosokawa in view of the Applicant's Admitted Prior Art.

Regarding claims 21 and 23, the combination of Al-Salqan and Hosokawa does not disclose wherein the security module is a separate hardware security module and wherein encrypting the data is performed within the security module. However, it would have been logical to one of ordinary skill in the art employ a security module to provide security to data. Furthermore, it would have been logical to one of ordinary skill in the art to utilize hardware versus software, as hardware is known to provide advantages in security and performance. The applicants, themselves, attest to the above facts in their disclosure of the known prior art. The applicants have admitted that prior art comprises the use of hardware security modules and that the hardware security modules are useable for encrypting data that a user desires to be secured (Spec., page 2, pars. 1 – 3).

It would have been obvious to one of ordinary skill in the art to employ the prior art teachings disclosed by the Applicants within the combination of Al-Salqan and Hosokawa. This would have been obvious because one of ordinary skill in the art would

Art Unit: 2137

have been motivated to employ methods that are logical and have been known to be
 feasible in prior art technology.

Page 11

Regarding claims 24, 26, 27, and 29, they are the system means and computer program product claims implementing the method of claims 21 and 23, and they are rejected, at least, for the same reasons.

Response to Arguments

Applicant's arguments filed 12/11/05 have been fully considered but they are not persuasive.

The applicant's representative argues primarily that:

1. As discussed with the Examiner, Applicants have amended the independent claims to include the limitations of original claims 2 – 5 (Remarks, pg. 4, par. 4).

The examiner would like to respectfully point out that the applicant's representative is mistaken. While the added limitations to the amended claims 1, 8, and 14 bear a semblance to the limitations found within the original claims of 2 – 5, a comparison of the newly added limitations to the original limitations reveals that the newly added limitations are not the same limitations found within the original claims.

Art Unit: 2137

1 Thus, the newly added limitations to the independent claims 1, 8, and 14 comprise

Page 12

2 limitations that have not been previously considered in the prior office action.

3

7

8

9

10

11

12

13

14

4 II. First, Applicants claim "receiving, at security module, a first password 5 corresponding to a software application." Al-Salgan's passwords do not correspond to a 6 software application (Remarks, pg. 6, par. 2).

In response, the examiner asserts that Al-Salqan teaches software employed by user to provision a password and a password that has been provisioned by software (refer to the discussion respecting the rejection of claim 1). Naturally, a correspondence exists between a provisioned password and password provisioning software simply by virtue of the provisioning. The examiner respectfully points out that if the applicant's representative desires to argue a more specific type of correspondence, then such a particular type of correspondence should be claimed - as opposed to nebulously claiming "corresponding".

15

16

17

18

19

20

21

III. Second, Applicant's claim "returning the encrypted tied key to the software application"...

As can be seen from the above excerpt, Al-Salgan teaches passing the encrypted key to a storage area or to a user for storage elsewhere. As such, Al-Salgan never teaches or suggests a software application ... (Remarks, pg. 7).

In response the examiner respectfully asserts that the applicant's representative 22 is mistaken and has mischaracterized the prior art. The examiner affirms, as is

Art Unit: 2137

1

5

6

7

8

9

10

11

12

THE. 2107

Page 13

2 implementing a security module as well as software for enabling a user (human) to

3 interact with the security module. Such an interface exists, as a human does not

4 interact with a software security module directly. Naturally the inputs and outputs of the

explained in the rejection of claims 1, 8, and 14, that Al-Salgan discloses software for

security module (Al-Salqan, figs. 2, 3) do not connect directly to a human (i.e. electronic

data bits dropped into the palm of a user's hand). The examiner finds the argument of

the applicant's representative (namely, there does not exist an application of software

between a user and the security module) to be unpersuasive.

Furthermore, it is interesting to note, that the applicant's themselves, similar to Al-Salqan, interchangeably use terms referring to humans when describing the interaction between an application of software and a security module (Spec., pg. 2, par.

4). Thus, the examiner finds the arguments of the applicant's representative to be inconsistent with the applicant's disclosure.

14

15

16

17

18

19

20

21

22

13

IV. Third, Applicants claim "encrypting data <u>provided by the software application</u> using the recovered generated key." Since Applicants' claim 1 should be viewed as a whole, the software application provides passwords, receives the encrypted tied key, and provides data to be encrypted by the security module. Al-Salqan never teaches or suggests a software application performing these limitations while interacting with the security module as claimed by Applicants (Remarks, pg. 8, par. 1).

In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies

Art Unit: 2137

1 (i.e., the software application provides passwords, receives the encrypted tied key, and

Page 14

2 provides data to be encrypted by the security module) are not recited in the rejected

claim(s). Although the claims are interpreted in light of the specification, limitations from

the specification are not read into the claims. See In re Van Geuns, 988 F.2d 1181, 26

5 USPQ2d 1057 (Fed. Cir. 1993).

9 Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
